Sorry for the long post, but I don't know how to shorten it. A: @{} are internal variables used by the C# compiler. They are not directly expandable and have no meaning at the C# program level. Fetal ultrasound screening in asymptomatic adults with cochlear implants: a report of three cases. The fact that cochlear implants (CIs) effectively restore hearing to many people with severe-to-profound sensorineural hearing loss (SNHL) necessitates a review of indications for CI in adults. Indeed, the common perception is that CIs are not ideal for patients with current or previous ear infections, otitis media, recurrent meningitis, or those with a history of use of ototoxic medication. Fetal ultrasound provides excellent imaging of the cochlea and auditory nerve. The aim of this retrospective study was to assess the safety of performing fetal ultrasound screening for adults with CIs. Fetal ultrasound was performed on three women aged 42, 33, and 27 years with bilateral CIs who had no complaints of auditory symptoms. All women were examined by means of high-resolution transabdominal ultrasound (Hi-Res TUS) and by Doppler spectral analysis. Hi-Res TUS showed the CI in all three patients. In addition, the first two women had bilateral labyrinthine artery pulsations with typical waveform, indicating normal cochlea function. The third woman had no pulsatile sound signal and pulsations were not confirmed bilaterally. As a result, fetal HI-Res TUS detected not only CI in the three women, but also bilateral extra cochlear signals of cochlea and carotid arteries. Fetal ultrasound provided useful information for patients with implanted devices. Subjects with CI, especially those with bilateral CIs, may have normal auditory function if they undergo fetal HI-Res TUS examination. Therefore, fetal ultrasound screening is recommended for all adults with CIs. A study of the computerized analysis of digital breast tomosynthesis (DBT) images. In this study, a simple method of assessing the ability of the computer to measure breast radiodensity is described. The objective is to compare the use of fixed thresholds to the use of the logarithmic transformation of the equation of the regression line of the breast density in digital mammograms. This paper discusses the effect of image viewing conditions, the number of images used in the study and

A: This happens because the Sitecore is loading different config files from the same web request asynchronously. More information can be found in this SO question Sitecore async web requests. And here is a nice tutorial how to fix it. Update In order to pass Sitecore model to the View, it is better to define the model in a ViewModel and pass it to the View. In View: @model MyViewModel ... @Html.Sitecore().Inherit(Model.MyModel); In the ViewModel: public class MyViewModel { public Sitecore.Resources.Models.DataSources.MyModel MyModel {get; set; } } Now you can pass the MyModel to the view and use it in the Razor files: @model MyViewModel

```
@Html.Sitecore().Inherit(Model.MyModel);
@Html.Sitecore().Inherit(Model.MyModel);
@Html.Sitecore().Inherit(Model.MyModel.Item.Fields.Field[1].DataSource); , "WSCU" (Wisconsin State Corrections Union) and the State Employees Union, "SEIU" (Service Employees International Union). The American Federation of State, County and Municipal Employees, AFL-CIO (AFSCME) is America's largest public-employee union. AFSCME, formerly known as the American Federation of Labor, included all public employees, not just teachers. This new transformation of the AFL-CIO in late 2017/early 2018 was led by, among others, AFT President Randi Weingarten, American Federation of Teachers President Randi Weingarten and SEIU President Mary Kay Henry. The union system has other regional labor federations, including: AFL-CIO District 6, representing about 1 million workers in Connecticut, New Hampshire and Rhode Island; AFL-CIO District 7, representing about 1.5 million workers in Maine and New Hampshire; AFL-CIO District 8, representing about 350,000 workers in New York, New Jersey and Pennsylvania; AFL-CIO District 9, representing about 800,000 workers in Minnesota and Wisconsin; AFL-CIO District 10, representing about 300,000 workers in Illinois, Indiana, Kentucky, Michigan and Ohio; AFL-CIO District 11, representing about 700,000 workers in New York, North Carolina, Pennsylvania, South Carolina, Tennessee and Virginia; AFL 1cdb36666d

Simultaneous observation of the rat medial vestibular nucleus with the vestibular nerve, oculomotor nerve, and trigeminal nerve using a combined electrophysiological and neurohistological method. By combining the electrophysiological, neurohistological, and axon transport methods, the medial vestibular nucleus (MVN) was continuously observed in 5

adult rats. The motor evoked potential in the trigeminal nerve was studied in the same animals, and an animal was also subjected to the axon transport technique. The MVN was confirmed in the mediolateral direction and in the rostrocaudal direction. The location of the oculomotor nucleus was also confirmed. The major sensory nuclei of the trigeminal nerve and the vestibular nerve were located within the MVN. The trigeminal nerve and the vestibular nerve separated in the rostral part of the MVN, and these nuclei were in turn separated in the caudal part of the MVN. In both of the rostral and caudal parts of the MVN, the MVN was divided into several smaller nuclei which were similar to the nuclei already seen in the internal capsule. The trigeminal nerve separated in the caudal part of the MVN, and these nuclei formed a small cluster. At this time, a strong synaptophysin immunoreaction was observed in the neuropil surrounding the nuclei of the MVN, indicating a complex synaptic connectivity.

These combined observations revealed the projection and interconnectivity of the nuclei of the vestibular nerve and trigeminal nerve in the central nervous system. CR33]. Second, using a

limited number of time-points for the measurement of baseline and induced levels of inflammasome markers in monocytes may have limited the detection of smaller changes in baseline or induced levels, and therefore our results may underestimate the true degree of regulation of the inflammasome in response to methionine. However, these findings were consistent with *ex vivo* measurements of cytokines in colorectal cancer cell lines in the absence of the tumor microenvironment [\[\[@CR34\]\]](#), and in PBMCs from healthy donors stimulated with LPS [\[\[@CR31\]\]](#). Conclusions [{#Sec11}](#) ===== In conclusion, our results suggest that serum levels of Met/hMet are associated with the proinflammatory
